-!- FUNCTION: CADHERINS ARE CALCIUM DEPENDENT CELL ADHESION PROTEINS.
THEY PREFERENTIALLY INTERACT WITH THEMSELVES IN A HOMOPHILIC
MANNER IN CONNECTING CELLS; CADHERINS MAY THUS CONTRIBUTE TO THE
SORTING OF HETEROGENOUS CELL TYPES.
-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

Mean 26.631; Variance 35.345; scale 0.753

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The intrinsic disease
That also is a sequence motified and and is a sequence motified as a sequence of class in individual to an acid correction.

CC (MBP) polypeptide which is capable of tolerising an individual to an automatigen; or an isolated human pathogen polypeptide correction of tolerising an individual to that polypeptide. In both cases, the polypeptide (whether self or non-self) includes an amino acid correction, such as HLA-DR, which is associated with a human autorisative disease and which binds to the polypeptide to activate autoreactive corresponding which binds to the polypeptide to activate autoreactive disease and which binds to the polypeptide to activate autoreactive corrections in individuals with the autoimmune disease. This peptide is derived from the human desmoglein 3 protein (amino acids 190-204) cand is implicated as a self epitope in pemphigus vulgaris. Peptides for a serived from the human desmoglein protein are described in W04841-47.
                                                                                                                                                                                                                                                                                                                                               RESULT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The patent describes a new preparation of microparticles each comprising a polymeric matrix and a nucleic acid. The polymeric matrix consists of one or more synthetic polymers having a solubility in water of less than 1 mg/l (e.g. poly-lactic-co-glycolic acid); and at least 90% of the microparticles have a diameter of less than 20 microns. The microparticles are useful for the delivery of nucleic acids to phagocytic cells. In one embodiment the microparticles are less than 20 microns in diameter and the nucleic acid (preferably in Closed circular form) includes an expression control sequence operatively linked to a coding sequence, where the expression product of the coding sequence is a polypeptide having a length and a sequence which permits it to bind to an MHC class I or II molecule. The response in mammals. The present sequence, an antigenic portion of desmoglein 3, is an example of an MHC class II peptide which can be expressed by the nucleic acid. It is associated with pemphigus

                                                                      foliaceus patient autoantibody which comprises the constant region of IgG linked to the extracellular region of pemphigus foliaceus antigen protein through the hinge portion. Pemphigus foliaceus is a chronic, generalised, vesicular and scaling skin eruption similiar to dermatitis herpetiformis. The pemphigus foliaceus antigen fusion protein is useful to treat pemphigus foliaceus. The antigen is especially administered through an acornent upon which the fusion protein is immobilised via a carrier. The fusion protein is also useful for detecting pemphigus foliaceus antibodies which is useful in immondiagnosis. The fusion protein has little or no side effect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             and its encoding DNA may be used in the diagnosis and treatment pemphigus vulgaris. It is thought that the antigen may be a cell adhesion molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA encoding pemphigus vulgaris antigen diagnostic and therapeutic uses Disclosure; Fig 7; 50pp; English. Pranke of epithelial or carcinoma cells, not bound to desmosomes, useful for diagnosis and treatment of carcinoma micrometastases Claim 7; Page 5; 8pp; German.

The present sequence is a segment of the desmosomal cadherin (DC), desmoglein Dsg2, which is exposed on the surface of epithelial or carcinoma cells and not bound to desmosomes. An antibody (Ab) directed against epitopes of the present sequence can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

The Ab provides rapid and reliable detection of metastatic carcinoma, and detects parts of DC that are not accessible in desmosome bound cells, as in normal tissue or carcinomas.
                          Human E-cadherin precursor.
E-cadherin; T-lymphocyte; alpha-E,beta-7 integrin;
auto1mmune disease; Crohn disease; psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      N-PSDB;

The human E-cadherin protein precursor (R85487) is expressed by an cDNA clone (T05764) derived from human liver. The extracellular ancount of E-cadherin is used to generate peptides that specifically bind to heterotypic cognates of E-cadherin and which inhibit adhesion of intra-epithelial T-lymphocytes to E-cadherin-expressing epithelial or endothelial cells in vitro or in vivo, thereby modulating mucosal immune responses. Such peptides are also specifically reactive with a monoclonal antibody (E4.6 or E6.1) that binds to E-cadherin and that can inhibit T-cell binding.
                                        Recombinantly-generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of order Mononegavirales - having attenuating mutation in 3' genomic promoter region and RNA polymerase gene, useful as vaccine to immunise against such virus pisclosure; Page 246-254; 426pp; English.

This sequence represents the wild-type L protein from Human parainfluenza virus (HPIV-3) type 3 isolate JS. This sequence is used in a method which involves the isolation of recombinantly-generated, attenuated, attenuated, attenuated and process of the sequence is used in a method which involves the isolation of recombinantly-generated.
                                                                                                                                                                                                                                                                                                                                  HPIV-3 JS isolate wild-type L protein.
L protein; attenuation; non-segmented; negative single stranded RNA virus; Mononegavirales.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Inhibiting adhesion of T isolating agents to treat psoriasis, etc

This sequence represents the Human parainfluenza virus (HPIV-3) type 3 vaccine FRhl cp45 I protein. This sequence is used in a method which involves the isolation of recombinantly-generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of the order Mononegavirales which have at least 1 attenuating mutation in the RNZ genomic promoter region and at least 1 attenuating mutation in the RNZ genomic promoter region and at least 1 attenuating mutation in the RNZ genomic promoter region and at least 1 attenuating mutation in the RNZ genomic promoter region and at least 1 attenuating mutation in the RNZ genomic promoter region and at least 1 attenuating mutation in the RNZ genomic promoter region and at least 1 attenuating mutation in the RNZ genomic promoter region and at least 1 attenuating mutation in the RNZ genomic promoter region and at least 1 attenuating mutation in the RNZ genomic promoter region and at least 1 attenuating mutation in the RNZ genomic promoter region and at least 1 attenuating mutation in the RNZ genomic promoter region and at least 1 attenuating mutation in the RNZ genomic promoter region and at least 2 attenuating mutation in the RNZ genomic promoter region and at least 3 attenuating mutation in the RNZ genomic promoter region and at least 3 attenuating mutation in the RNZ genomic promoter region and at least 3 attenuating mutation in the RNZ genomic promoter region and at least 3 attenuating mutation in the RNZ genomic promoter region and at least 3 attenuating mutation in the RNZ genomic promoter region and at least 3 attenuating mutation in the RNZ genomic promoter region and at least 3 attenuating mutation in the RNZ genomic promoter region and at least 3 attenuating mutatio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   W48712

PT polymerase gene, useful as vaccine to immunise against such virus PS Disclosure; Page 283-291; 426pp; English.

CC This sequence represents the Human parainfluenza virus (HPIV-3) type 3 CC vaccine Vero cp45 L protein. This sequence is used in a method which CC involves the isolation of recombinantly-generated, attenuated, CC non-segmented, negative-sense, single stranded RNA virus of the order CC Mononegavirales which have at least 1 attenuating mutation in the 3' CC genomic promoter region and at least 1 attenuating mutation in the RNA CC polymerase gene. This RNA virus can be used as a vaccine to immunise an CC individual against such a virus.

PT culturing bilirubin oxidase prepn. useful as an analytical enzyme - by PT culturing bilirubin oxidase in transformant culture

PS Claim I; Page 29-32; 32pp; Japanese.

CC The sequence encodes bilirubin oxidase. The protein produced has a CC 38 amino acid signal peptide which is removed to give the mature CC protein (R40843).

Mean 25.594; Variance 33.108; scale 0.773

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Fri Jun 11 17:22:45 1999; MasPar time 2.44 Seconds 173.855 Million cell updates/sec

Tabular output not generated.

Description: Perfect Score: Sequence: Title: >US-08-991-628-3 (1-15) from US08991628.pep 96

LNSKIAFKIVSQEPA 15

Scoring table: PAM 150 Gap 15

Searched: 77977 seqs, 28268293 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

swiss-prot37 1:swissprot

Statistics: Mean 26.281; Variance 28.608; scale 0.919

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
